

ABSTRACT OF THE DISCLOSURE

An array panel for a transflective liquid crystal display device includes a substrate; a thin film transistor on the substrate; a first passivation layer covering the thin film transistor and having a first transmissive hole and an inclined portion surrounding the first transmissive hole; a transparent electrode on the first passivation layer, the transparent electrode contacting the thin film transistor; and a reflector over the transparent electrode, the reflector completely covering the inclined portion and having a second transmissive hole corresponding to the first transmissive hole.
